ACKNOWLEDGMENT

The acreage, production and value statistics in this bulletin are official State and USDA estimates prepared by the Florida Crop and Livestock Reporting Service. The county and area detail were made possible by the participation of the Department of Food and Resource Economics, University of Florida, in the estimating program. The Bureau of State Markets, Florida Department of Agriculture, and the County Extension Agents, University of Florida's Cooperative Extension Service, were also very helpful in supplying area and county information. Shipment statistics were provided by the Market News sections of the Florida Department of Agriculture and the USDA Agricultural Marketing Service.

Grower organizations have provided valuable assistance and data throughout the season. These groups include the Florida Celery Committee, Florida Tomato Committee, Florida Sweet Corn Exchange, South Florida Vegetable Exchange, Zellwood Sweet Corn Exchange, and North Florida Growers Exchange. Sales agencies and transportation firms provided the inputs necessary to complete the statistical story.

Foremost, the growers, shippers and processors volunteered most of the basic data used in developing these official statistics. The public spirited cooperation of these individuals and groups is appreciated.

Fieldmen James Spires, Immokalee; Charles Robertson, Homestead; Wallace Jacobs, North Palm Beach; and Larry Amlong of Palmetto collected much of the basic acreage, production and price statistics in this bulletin. This report was assembled under the direction of Harvey L. Batchelor, Gerald H. Moody and Carl A. Ouzts of the Florida Crop and Livestock Reporting Service and E. F. Scarborough, Bureau of Market News. The authors also wish to thank Becky Altman, Ray Crickenberger, Laverne Dobbs, Evelyn Faust, Kitty Hildreth, Wanda Hodges, Janet Meyer, Barbara Palmer, Jerry Sauer, Tommy Scherer, Cindy Wright and others of the Florida Crop and Livestock Reporting Service who assisted in compiling and preparing this report.

PRINCIPAL VEGETABLES BY PRODUCING AREAS

1. WEST
   - A. Escambia county - Potatoes.
   - B. Holmes-Jackson-Washington counties - Butter beans, field peas, watermelons.
   - C. Gadsden county - Pole beans, squash, sweet corn, tomatoes.
2. NORTH
   - D. Starke-Brooker-Lake Butler - Lima beans, snap beans, cucumbers, green peppers, squash, strawberries.
   - E. Hastings - Cabbage, potatoes.
   - F. Gainesville-Alachua - Bush beans, cucumbers, peppers, potatoes, squash.
   - G. Island Grove-Hawthorne - Cucumbers, peppers, sweet corn, squash, watermelons.
3. NORTH CENTRAL
   - H. Oxford-Pedro - Tomatoes, watermelons.
   - I. Sanford-Oviedo-Zellwood - Cabbage, carrots, celery, sweet corn, cucumbers, escarole, greens, lettuce, peppers, radishes, spinach.
   - J. Webster - Cucumbers, eggplant, peppers.
4. WEST CENTRAL
   - K. Plant City-Balm - Bush and pole beans, lima beans, cabbage, cucumbers, eggplant, field peas, greens, squash, strawberries, watermelons.
   - L. Palmetto-Ruskin - Cabbage, cauliflower, potatoes, strawberries, tomatoes, watermelons.
   - M. Sarasota - Cabbage, celery, sweet corn, escarole, lettuce, radishes.
   - N. Wauchula - Cucumbers, eggplant, peppers, tomatoes, watermelons.
5. EAST CENTRAL
   - O. Ft. Pierce - Tomatoes, watermelons.
6. SOUTHWEST
   - P. Ft. Myers-Immokalee - Sweet corn cucumbers, eggplant, peppers, potatoes, squash, tomatoes, watermelons.
7. EVERGLADES
   - Q. Bush beans, cabbage, celery, Chinese cabbage, sweet corn, escarole, greens, lettuce, potatoes, radishes.
8. SOUTHEAST
   - R. Martin county - Cabbage, potatoes, tomatoes, watermelons.
   - S. Pompano - Bush beans, lima beans, sweet corn, cucumbers, eggplant, peppers, squash, tomatoes.
   - T. Homestead - Bush and pole beans, cabbage, sweet corn, cucumbers, potatoes, squash, strawberries, tomatoes.

▨ Commercial Vegetables ▦ Watermelons

Florida: Usual dates for planting and harvesting vegetables, melons, potatoes, and strawberries

Crop	Planting Dates 1/	Usual Harvest Dates		
		Begins	Most Active	Ends
Snap Beans 2/	Aug 15 - Apr 1	Oct 15	Nov 1 - May 1	Jun 15
Cabbage	Sep 1 - Mar 15	Oct 25	Jan 1 - Apr 15	Jun 15
Carrots	Aug 15 - Feb 15	Nov 1	Dec 15 - May 25	Jun 10
Cantaloups	Jan 15 - Mar 15	Mar 10	May 15 - Jun 20	Jul 10

DEFINITIONS AND EXPLANATIONS

QUARTERLY GROUPS--During the growing season, estimates were prepared for most crops on a calendar quarter basis in order to indicate available supplies for shorter periods of time than the entire crop year. The Fall, Winter and Spring quarterly estimates are combined into a crop year total for all crops. Production sold or utilized is shown by months.

PLANTED ACREAGE is the total acreage which has been planted for harvest during one designated quarter. Acreage lost and replanted to the same crop in time for harvest in the same quarter, is counted only once. Acreage harvested and planted again to the same crop is counted twice.

HARVESTED ACREAGE is the acreage partially or completely harvested. Acreage lost before or at maturity through natural or economic causes is not included in the acreage for harvest.

YIELD is the average production per acre of merchantable quality harvested and sold or utilized.

PRODUCTION is the quantity actually harvested and sold or utilized.

UNIT VALUE for fresh market sales is the equivalent price received, f.o.b. shipping point basis and encompasses all grades and sizes marketed or utilized. Included are packing charges, selling charges, precooling, top ice, or other costs which contribute to the value of the product at shipping point. The value per unit for quantities sold to processors is the average value paid for usable quantities, on a "delivered to plant door" basis. This value includes transportation and other normal costs incident to delivery at plant door.

TOTAL VALUE is the equivalent value of production sold or utilized based on the unit value. Cullage and other quantities not sold or utilized because of natural or economic factors are excluded.

OTHER COUNTIES include harvested acreage for all counties for which either published data would result in the disclosure of individual operations or acreage totals for specific commodities are of minor importance in the State.

Beginning with the 1977-78 crop season, all shipments and unloads, rail, truck, air and boat, are recorded nationally in 10,000 pound units each day. Annual releases are in 1,000 cwt. In this publication shipments and unloads for some commodities were converted to most common trading units. Rail and piggyback weights and conversion factors were determined by several Market News Service field offices. Mixed car (rail) loadings by stations have been prorated by commodities.

Where possible the national Market News Service in Washington, D. C. has established a single uniform weight per commodity to be used nationally in converting to weight units for the various means of transportation. Weights per common container used and number of units per rail car or truck may be obtained by writing the MNS office in Winter Park, Florida.

PRODUCTION AND PRICE UNIT--The official USDA vegetable crop estimates are published on a weight basis. For this bulletin, the official estimates for most vegetable crops have been converted to what is believed to be the most commonly used containers. If changes in container weights are necessary, all data pertaining to the production of the commodity in question is revised to maintain comparability between years. The table below gives the net weight used per container and the number of containers per hundredweight.

PRODUCTION AND PRICE UNIT
Most Common Unit Estimated Net Weight, Number of Units per Hundredweight,
Principal Vegetable Commodities, Florida, 1978-79 Crop Season

Commodity	Unit	Est. Net Weight	No. of Units per Cwt.	Commodity	Unit	Est. Net Weight	No. of Units per Cwt.

SUMMARY OF THE 1978-79 VEGETABLE SEASON

The farm value of Florida grown vegetables, melons, potatoes and strawberries sold totaled a record $758.3 million, up $126.1 million from the 1977-78 crop year. Acreage harvested decreased 1 percent from the previous year. Crops showing the greatest gains in harvested acres were beans for processing, eggplant, lettuce, squash and strawberries. Crops increasing in value were snap beans, cabbage, celery, sweet corn, cucumbers, eggplant, lettuce, green peppers, squash, tomatoes, "other vegetables", watermelons and strawberries. Crops with lower values than the previous year were escarole, potatoes and radishes. Most of the declines were due to lower season average prices. Tomatoes, which rose $37.9 million, showed the greatest increase in value followed by cabbage which increased $22.0 million; "other vegetables," $14.9 million; lettuce, $10.8 million; cucumbers, $10.4 million and celery $8.0 million from a year ago.

Average yields for snap beans, celery, cucumbers, cabbage, lettuce, green peppers, potatoes, radishes, tomatoes and strawberries increased during the year but yields declined for eggplant, sweet corn, escarole, squash and watermelons.

Season average prices of cabbage, sweet corn, cucumbers, eggplant, green peppers, squash, tomatoes, watermelons and strawberries were higher than a year ago. Season average prices for snap beans, celery, escarole, lettuce, potatoes and radishes were below a year ago.

Land preparation, planting and transplanting were very active in most areas of the state during July. Growing conditions were generally good to excellent over most of the farming areas during August. Planting activity progressed favorably. Some damage to plants in low areas due to heavy rains occurred in late August and early September. Rainfall amounts were variable, averaging from 1 to 4 inches in general to as much as 6 inches in some areas. Numerous cold fronts accompanied by showers made up the weather picture during much of October and November. Planting and harvest activities were interrupted.

Temperatures were generally mild during most of December. A cold front moved through the southern farming areas about midmonth. The front was accompanied by showers, some locally heavy. The Jupiter area received from 8 to 10 inches of rainfall while other areas received less than an inch. A low pressure front stalled over the southern farming areas the last of the month. Scattered hail was reported in some areas.

Much of January was characterized by numerous cold fronts and temperatures in the 30's and 40's. The fronts were accompanied by strong winds and scattered, light showers. Precipitation was variable, ranging from a trace to 2-1/2 inches in some areas.

Cold weather and near freezing temperatures dominated the month of February. Several cold fronts moved through the vegetable growing areas, dropping nighttime temperatures into the low 30's. Damage to crops was generally light and confined mostly to light foliage burn.

Temperatures moderated somewhat in the farming areas in March, although cold fronts lowered nighttime temperatures into the 40's. Rainfall was generally light to moderate. Daytime temperatures were in the 70's and 80's.

During April, the weather picture consisted of sunny days and mild nights. From the first of the month to about midmonth negligible amounts of rain fell. A weak cold front moved through the southern vegetable growing areas the last of the month. Rainfall was variable, averaging from 1 to 16 inches. The front was accompanied by very strong and gusty winds of up to 50 miles per hour. Harvest was in full swing for some crops while others were declining seasonally.

The month of May was characterized by cloudy skies and numerous showers and thundershowers in central and southern vegetable growing areas. Rainfall averaged from 1 to 4 inches. Daytime temperatures were in 70's and 80's with nighttime lows in the 60's and low 70's. Harvest was very active for some vegetables while declining for others.

Hot days and warm nights dominated the weather picture during June in the vegetable growing areas. Some afternoon and evening scattered showers occurred and were more numerous towards the end of the month. Precipitation averaged from a few tenths to one inch but was locally heavy in some areas. The water table was lower than normal at the end of June. Crops were generally fair to very good in most areas.

Most of the weather data for this summary was supplied through the National Weather Service, U.S. Department of Commerce, Ruskin, Florida. Information on affects of weather on crops was provided by the Florida Crop and Livestock Reporting Service fieldmen.

SNAP BEANS
1978-79

Florida growers produced 6.3 million bushels of bush and pole beans during the 1978-79 season for fresh and processing utilization, up 14 percent from last year. Acreage harvested for fresh and processing totaled 54,100 acres, up 6 percent from the 51,000 acres harvested during the previous season. The average yield for the 1978-79 season was 102 bushels per acre for fresh and 163 bushels per acre for processing, as compared with 101 bushels and 133 bushels per acre, respectively, the previous year.

The average f.o.b. price of $7.58 per bushel for fresh market was 48 cents more than the previous year and a record high. At $2.22 per bushel, snap beans for processing are down 26 cents from last season. Total value, at $36.2 million, was 1 percent above last year.

Bush beans are grown in all areas of Florida with the exception of the east central and southwest areas. The southeast continues to be the major producing area. Pole beans are produced primarily in Dade County, with a small acreage grown in Gadsden and Marion counties and west central areas.

Earliest fall supplies of snap beans originate from West Florida. The north and west central areas, the Everglades and southeastern districts also provide fall production. The southeast is the sole source of supply during the winter. The other areas resume production in the spring.

Snap bean production extended from late September into mid June. The fall crop peaked in November, followed by a slight decline in marketings in December and a drop in January and February. Production began to increase in March, and the spring crop peaked in April. Twenty-one percent of the marketings occurred in April, down one point from April the previous year.

Variable weather influenced last year's bean crop. Heavy early to mid-October rains in the southeast washed beds and leached fertilizer, necessitating moderate reseeding. During the winter season, strong, cold winds whipped plants and burned tender foliage and pin beans. Weather during the spring season was generally favorable. Strong winds at times caused light burn to foliage and some fruit scarring. Quality and yields were generally good to very good for the spring season.

CABBAGE
1978-79

Florida's cabbage growers produced 8.4 million crates and sacks during the 1978-79 season. The gross value was $51.9 million, an increase of 8 percent from the previous record of $48.2 million set during the 1976-77 season. The average f.o.b. price was $6.17 per crate or sack, up $1.58 from the $4.59 received last year but 36 cents less than the record high set during the 1976-77 season.

Total acres planted amounted to 18,300 – up 3 percent from the previous season. Acreage harvested totaled 17,800, an increase of 8 percent from the year before. Yields were higher than a year ago and averaged 472 crates per acre, up 77 crates and the highest since the 1975-76 season.

Cabbage was available for market beginning in late November and continuing through June. Sales were above normal for the fall period and the highest since the 1971-72 season. The peak month was January, followed closely by April, while February and March were tied for third.

The Hastings area, which includes Flagler, Putnam and St. Johns counties continued as the state's largest producing area, accounting for 52 percent of the state's production. St. Johns County led all other counties in acreage with nearly 28 percent of the total acres harvested in the state.

Direct seeding and early transplanting got underway by late August and early September. The most active period for transplanting was from October through December while direct seeding in fields occurred between August and November. Only a small percentage of the total acreage planted is seeded direct in fields.

First cuttings began in early November. Harvest increased rapidly during January and then slowed a little through February and March. Winter production accounted for 55 percent of the total crop. Volume was heavy in April but total spring production was down sharply from the previous spring.

CARROTS
1978-79

Production of carrots in Florida continued to gain during the year. There were 1,177,000 cwt. shipped out of state for both fresh use and processing. Fresh market use constituted 74 percent and processing 26 percent. This compares with 79 percent fresh and 21 percent processing the previous year. Of the carrots shipped for fresh market, 17 percent were the mini type and 83 percent were regular. Carrots are not part of the regular statistical program in Florida, therefore, data on acreage and production are not published separately. However, data are included in "other vegetables."

The muck soils around Lake Apopka, near Zellwood and the Everglades provide a good medium for growth. By far the majority of carrots are grown in the Zellwood area. The mini or finger carrot movement usually begins in late October and is complete by the end of May. Regular size carrots are harvested from November through June. The peak harvest period last season was mid January to early May. The young carrots are subject to cold damage in January and February in the Zellwood area. With the exception of several cold fronts which lasted only a few days, growing conditions were mostly favorable. Size and quality were good throughout the season.

CELERY
1978-79

Florida celery marketings of 8.4 million crates were harvested from 11,700 acres during the 1978-79 growing season. The average yield of 695 crates per acre compares with 588 crates the previous year.

Prices averaged lower than the previous year and at $6.78 f.o.b. per crate, compared with $7.36 per crate in the 1977-78 season. Prices during the fall quarter averaged above a year earlier, the same for the winter quarter but were well below for the spring quarter. The crop was valued at $55.1 million, an increase of 17 percent from the previous crop year.

The Everglades, with 88 percent of the harvested acreage, was the foremost area of production throughout the season. The north central area supplemented by a light supply from the Sarasota area, accounted for the remaining 12 percent of acreage and provided a continuous supply throughout the season.

Plant bed preparation and seeding were underway by mid June. Transplantings were gaining momentum by late August and increased to a good level by mid September. Plantings in the Everglades were winding down by the end of March and were complete by early April. Plantings were also complete in the north central area by the first week of April. Growers in the Sarasota area usually plant from October to March.

Light harvest began by late October in the Zellwood area and by early November in the Everglades. Growing conditions were hot and humid in the summer and early fall months. Cool weather in November was beneficial for growth and development. Quality was generally good during most of the season. Yields and size were good and averaged above normal.

No significant damage occurred from cold fronts moving into the vegetable growing areas. The spring market was generally favorable but prices averaged below the previous spring when the market was very good. Approximately 5 percent of the crop was not harvested for various reasons. Growers passed some acreage in order to maintain good quality.

Celery production was most active during December through May. Cutting was completed by July 1 in all areas.

Celery is subject to a federal marketing order administered by the Florida Celery Committee. Field supervisors provide the basic acreage and production data. In cooperation with the committee, these data are assembled into weekly, monthly and annual reports.

CHINESE CABBAGE
1978-79

Chinese cabbage is grown primarily on the mucklands of Zellwood and the Everglades areas. The organic soils provide a very good medium for rapid growth. Harvest was underway by November. Volume was light through November but increased to good supplies by mid December and January. Production reached a peak level in March and April. Good volume was available from December through mid May.

During mid April, Zellwood was providing a good volume while the Everglades was declining seasonally. The season was over by June 1. Yields and quality were generally good throughout the season. The winter was relatively mild and no significant cold damage occurred. Shipments for the season totaled 163,000, down 4 percent from the previous year.

SWEET CORN
1978-79

Florida, the nation's leading sweet corn producer for fresh sales, marketed 12.1 million crates during the 1978-79 season. Production decreased 4 percent from the previous year. Growers harvested 54,500 acres, down 4 percent from the 56,500 acres harvested during the 1977-78 season. Yields averaged 222 crates per acre statewide compared with 224 crates per acre a year earlier. Yields have averaged above 200 crates per acre for every year since the record 244 crate average in the 1972-73 crop year.

The season average f.o.b. price of $4.25 per crate was 36 cents above the average for the previous year. The total value of the crop was $51.4 million, up $2.2 million from the $49.2 million received for the 1977-78 crop. The value of sweet corn ranked fourth in the state in vegetable crops and was exceeded only by the value of tomatoes, celery and cabbage.

First plantings of the season were underway in the Everglades in July. Seeding on the east coast got underway in early October and increased rapidly. Plantings were interrupted by adverse weather in late October in the east coast area. First harvest began in the Everglades in the week ended September 16th and reached a fall peak in November. The declining harvest in the Everglades during December was partially offset by harvest from the lower east coast and Dade County.

Harvest of the spring crop in the Everglades was underway by mid April. The Everglades became the main source of supply in late April as the east coast and Dade County began to phase out. The transition of harvest from the Everglades to Zellwood occurred in mid May. Lake County provided a good volume in June. The season was complete in early July.

A small acreage provided supplemental supplies at Zellwood and the west central area during the early fall, and at Sarasota in the early spring.

Weather during the growing season was generally favorable. Heavy rains interrupted plantings, washed beds and leached fertilizer in some areas during the mid fall growing season. In January, heavy rains and strong, cold winds affected plant growth, whipped plants and caused light to moderate leaf burn in the lower east coast. Strong winds and blowing sand caused some damage to young plants in the lower east coast in early February. Conditions for the spring crop were very good. Quality and yields were very good to excellent for most of the season.

CUCUMBERS
1978-79

Florida production of cucumbers for fresh market and processing utilization during the 1978-79 crop year was over 6.0 million bushels, up 8 percent from the 1977-78 crop. The fresh market channel utilized 80 percent of the production and the remaining 20 percent was for processing. The 23,300 acres planted was up 200 acres from the previous year. Harvested acres totaled 22,000, unchanged from a year earlier. Average yield per acre for fresh market, at 307 bushels, was up 25 bushels from the previous season. Cucumbers for processing averaged 187 bushels per acre, as compared with 177 bushels last year. Total production was valued at $37.6 million compared with $27.2 million for the previous year. The f.o.b. price for 1978-79 averaged $6.65 per bushel for fresh market and $4.73 per bushel for processing, as compared with $5.03 and $4.39 per bushel, respectively, the previous year.

Supplies in 1978-79 were generally available from September through June, with light marketings in January through March. Much of the recorded shipments moving out-of-state January through March are from offshore and truck imports resold in mixed loads.

The production of cucumbers is well distributed across the state. The southwest area, with 40 percent of the planted acreage during 1978-79, is the largest area. The west central area accounted for 34 percent of the planted acres in the state. The west, north central and southeast areas provide the remaining crop.

Weather during much of the growing season was generally very favorable. Most crops were in good to excellent condition during the fall, but suffered some from the dry spell in late September. Gusty winds and shifting sand in early November caused light to moderate leaf burn in unprotected fields. The weather during December was unseasonably warm. Some fields came into production several weeks early. In early January, strong, cold winds caused severe damage to the remaining fall acreage. Conditions for the spring crop were mostly good although the season got off to a poor start due to adverse weather. Yields, size, quality and color were very good most of the season.

EGGPLANT
1978-79

Plantings of 3,100 acres were 29 percent above the 1977-78 season. Yields averaged 585 bushels per acre, 75 bushels below the previous season. Weather was generally very favorable during much of the growing season with the exception of the winter season. However, during late December and early January, strong winds whipped plants, scarred fruit and burned tender leaves. Poor market conditions caused some abandonment of older fields. In early February, near freezing temperatures caused bloom droppage and slowed growth and fruit set. Wind scarring lowered packout. Growing conditions during the spring quarter were very good but heavy rains in late April caused some plant damage. Quality, size and yields were generally good to very good.

Production of eggplant increased to 1.6 million bushels, 10 percent above last year's production. Total sales increased to $6.8 million compared with $5.6 million a year earlier. The increase was due to 24 percent more harvested acres, higher production and price per bushel which offset the lower yields per acre. The season average price of $4.14 per bushel is 34 cents higher than a year ago. The winter and spring crops were higher in price than a year earlier but the fall crop was lower.

The distribution of marketings was generally normal. Harvest began in late September, reached a peak in November and dropped during the winter. Harvest began to increase in April and reached a spring peak in June. Harvest was virtually complete by early July. The southeast area around Pompano accounted for 45.0 percent of the harvested acreage. The northern and central areas combined contributed 49.3 percent of acreage harvested with the remaining small acreage in the southwest.

Production is generally continuous through the entire crop year in the southeast and southwest, while the crops in western, northern and central areas are for fall and spring harvest only. Those areas receive too much freezing weather to grow eggplant during the winter months.

First sales were from cuttings in the western and northern growing areas in late September. Harvest followed the usual pattern and progressed southward in the fall, continued through the winter in southern areas and then moved back northward in the spring.

ESCAROLE-ENDIVE
1978-79

Production of escarole and endive during the 1978-79 season totaled 3.3 million crates, up .1 million crates from a year ago. The 6,500 acres harvested was up 400 acres from the previous season. Yields per acre averaged 515 crates compared with 535 crates the previous year.

Prices during the season averaged $4.05 per crate, compared with $4.63 a year earlier. The total value of sales, at $13.5 million, was 10 percent below the previous year.

The Everglades, which had 79 percent of the harvested acreage in the 1978-79 season, began seeding in mid September. Weekly planting schedules continued through March. Light harvest began in late October and supplies were continuous through early June. The mucklands around Zellwood provided good volume in the late spring months. The smaller acreage grown on Lake Placid and Sarasota mucklands also furnished supplemental supplies during much of the season.

Sales started relatively slow in October but increased considerably to a good volume by November. Marketings reached peak levels in March. Good volume continued into May. Harvest declined seasonally and was over by early June.

Growing conditions were generally favorable during most of the season. Very little if any damage was reported during the winter months. In early to mid April hot, dry weather caused some problems. Quality of escarole and endive was mostly good throughout the season.

LETTUCE
1978-79

Florida lettuce growers produced a record 2.6 million hundredweight during the 1978-79 season. This was 31 percent above the previous season. A 29 percent increase in acreage along with a yield increase of 4 cwt. per acre contributed to the record production. Average yield of 199 cwt. per acre compares with 195 cwt. for the previous season. The season average f.o.b. price of $18.75 per cwt. was 34 cents below the average for the previous season. Prices were about the same as a year earlier for the fall quarter but were well above a year ago for the winter quarter. Prices during the spring quarter averaged well below the spring quarter a year earlier.

Acreage, production and value statistics of lettuce in this bulletin combine the various types into a single estimate. The types in order of importance include iceberg, 56 percent; romaine, 21 percent; Boston, 11 percent; bibb and leaf combined, 12 percent of the total acreage harvested. Iceberg continued the rapid growth that began several years ago. The Everglades muckland accounted for 87 percent of planted acreage and was the source of a continuous supply of lettuce which began in early November and ended in early June. Outside the Everglades, Zellwood is the other major producing area, with Sarasota and the Lake Placid mucklands contributing light supplies during most of the season.

Seeding was underway in early September. All areas were actively planting by early October. The Everglades and Sarasota areas had continuous plantings through March.

Light harvest was underway by late October and continued light until mid November. Volume gained in late November and December, with growers actively cutting in most areas. The Everglades continued to provide the bulk of the volume during the winter period. Supplies peaked in March and April and declined to the season's end by early June. Volume from the Zellwood area was light during the winter months. Moderate supplies are available from this area during the fall and spring seasons.

Growing conditions in the early fall were hot and humid. However, growth was rapid. Cold temperatures during January caused some light damage to young foliage and reduced supplies in the Zellwood area. Heavy volume was available statewide in March and April. Quality was generally good throughout the season.

PEPPERS
1978-1979

During the 1978-79 season, Florida produced 8.1 million bushels of peppers, a 1 percent decline from the previous year. The average yield of 445 bushels per acre was 3 percent above the 434 bushels last season. Production was from 4 percent fewer acres.

The season average f.o.b. price of $6.13 per bushel was up from an average of $5.17 for the previous year. The total value of $49.4 million was 17 percent above the previous year. Prices were generally good during the winter period. Marketings were light in October but increased to a good level by December. Supplies decreased during the winter months but began an upward swing in April. The peak spring production occurred in May. The season then declined and was mostly over by the end of June.

The 3 percent decrease in total planted acreage was the result of an 8 percent drop in the heavy producing southwest area. Increases in the north, north central, west central and southeast areas were not enough to offset the decrease. The southwest accounted for 54 percent of the state's total pepper acreage. The southeast had 21 percent; the north central area, 10 percent; the north, 8 percent; and the west central area, 7 percent.

During September hot weather and dampoff necessitated excessive replanting to improve stands. Conditions during the remainder of the fall season were generally good to excellent. Strong, cold winds during the winter months caused foliage burn to young crops. Spring weather conditions were generally favorable. Yields were good to very good.

POTATOES
1978-79

Production of potatoes in 1979, including both winter and spring seasons, totaled 6 million cwt., up 6 percent from the previous year. A total of 30,700 acres were planted, a decline of slightly over 6 percent from the 32,800 acres planted for the 1977-78 season. Of the total acres planted, 28,000 acres were harvested, 13 percent less than the year before. The value of the crop was $30.4 million, down 13 percent from 1978. The decrease in value was attributed to the lower average price received for the Hastings crops.

The average yield was a record at 215 cwt. per acre, exceeding the previous record yield of 206 cwt. set in 1977. The spring yields were up sharply from the previous year. In the Hastings area, which includes the three counties of Flagler, Putnam and St. Johns, the average yield was a record high of 230 cwt. and well above the 170 cwt. produced in 1978. Spring potatoes grown in all other areas, ranging from the Ft. Myers area in the south to northern Escambia County in the Panhandle, averaged 180 cwt. per acre, well above the 125 cwt. the year before. The winter crop averaged 185 cwt., down 10 cwt. from the 1978 winter season.

The 1979 season average price for all potatoes at $5.06 per cwt. was $1.15 less than the previous season and the lowest price since the 1975 crop. Low prices received in May and June in the Hastings area held the all potato price to the low level.

The "red-skinned" varieties are the dominant variety grown for winter harvest in south Florida. Most of the winter crop is sold for table stock but a few are sold to the potato chip industry. In the Hastings area the "white skinned" varieties dominate. A large percentage of the crop is used in the potato chip industry. Both "whites" and "reds" are grown in the area and sold for table stock.

The winter potato harvest was underway in January but the crop was later than normal and harvest extended into the spring months, with March and April being the heaviest shipping period. Approximately 1,000 acres were abandoned when heavy rains hit the area late in the season. Harvest of the spring crop in the Hastings area got underway in April with peak harvest in May. Digging continued into June but prices dropped considerably and many growers either quit harvesting or dug only the better yielding acreage. Abandonment in the area was much higher than usual. There was some effort to dig some acreage in July but this acreage was not very large.

RADISHES
1978-79

In 1978-79, radish plantings amounted to 33,600 acres compared with 32,000 acres planted the previous year. Acres harvested totaled 29,600 – a record high – compared with 28,200 in 1977-78. Yield per acre averaged 340 cartons compared with 287 cartons the previous season. The crop was valued at $21.9 million, down 1 percent from a year earlier. The average f.o.b. price was $2.17 per carton, down 57 cents from the previous year.

A good supply of both red and white radishes was available from Zellwood, Lake Placid and the Everglades from October through May with a light volume going into June. The fall peak harvest occurred in November. The spring peak occurred in April. Seeding of the 1978-79 crop was underway in the Everglades and north central areas in early September. Early crops progressed very favorably. Light harvest was underway in late September and became quite active in mid November. Supplemental supplies were available from Lake Placid and Sarasota during the year.

SPINACH FOR PROCESSING
1978-79

Spinach statistics have not been published separately for Florida in recent years in order to avoid disclosure of individual operations. However, data for these seasons have been included in the "other vegetables" series shown in this publication. Data for 1973 and earlier are available upon request. Yields per acre and harvested acres declined due to unfavorable weather during the winter months in the north central area where most of the crop is grown.

SQUASH
1978-79

Florida's production of squash during the 1978-79 season, at 1.9 million bushels, is .2 million bushels above last year. Harvested acreage totaling 13,350 acres, increased 13 percent from the previous year. The yield, at 139 bushels per acre, was down 4 bushels from the previous year.

The average f.o.b. price of $7.51 per bushel was up $3.23 from last season. Total f.o.b. cash receipts amounted to nearly $14.0 million. Prices were generally favorable throughout the season.

Florida produces acorn, butternut, yellow crookneck, yellow straightneck, white and zucchini squash. Dade County with 25 percent of the state's harvested acreage in 1978-79, produces yellow crookneck almost exclusively. The Pompano area, in addition to being a major producing area, is also an important market for squash grown in other areas of the state. This is especially true when local supplies reach low levels during the winter months. The southwest area produces a continuous supply of most types. Central, north and west Florida provide a good volume of most types during the fall and spring season.

Squash is one of the few crops grown in Florida that is shipped every month of the year, although shipments during the summer are usually light and confined mostly to local markets. The 1978-79 season got off to a good start. Marketings increased to a fall peak in November and early December before showing a seasonal decline during the winter months. In late October and mid to late November, heavy rains delayed field work and reduced quality, yields and packout. During the winter months, January through March, cold temperatures and strong winds slowed growth, caused extensive foliage burn and plant kill to both old and young crops. Weather was favorable during the spring quarter although there was some foliage burn and fruit scarring. Peak marketings for the season occurred in April.

STRAWBERRIES
1978-79

Florida strawberry growers produced 3.7 million flats of berries during the 1978-79 season, up 32 percent from the previous year. Harvested acreage totaling 2,400 acres increased 20 percent from a year earlier. Average yield of 1,561 flats per acre increased from the 1,415 flats a year earlier. The f.o.b. return per flat for the season was $5.91, up 3 cents from the previous season. The value of the crop was a record $22.2 million, up $5.5 million from the $16.6 million received a year ago.

Laying of plastic and other field work was in full swing by late September in the important Plant City-Ruskin area. Transplanting began by mid October and increased rapidly for several weeks.Transplantings were virtually complete by mid November. Light harvest was underway by mid December in the Plant City and Dade areas. Early harvested berries were primarily for local use and roadside stands. Light shipments began in January and reached peak volume in March and April. Most of the commercial harvest was completed by late April. U-Pick harvest continued active during May. Plant growth was good. Cold weather in early January caused some fruit and bloom loss. Plants improved in late January and bloom and fruit set were abundant by mid February. Rains during several occasions in February and early March reduced quality. Volume was up sharply by late March and early April. Quality and size were very good. First harvest was underway in Bradford County by early April and the season was drawing to a close around mid May. Yields and quality were excellent.

TOMATOES
1978-79

The total value of the Florida tomato crop for fresh and processing utilization increased from last season. The $220.2 million was 21 percent above the previous season and reached an all time record high value. The main factor contributing to the increase was the very mild late winter and spring seasons which enabled growers to get considerably more pickings than usual. Prices held up well which gave the incentive to extend the harvest period much longer than usual, especially in Dade County and the Immokolee area.

Total production of 34.8 million 30-pound carton equivalents was 16 percent above the previous season. The fresh market channel utilized 96 percent of the production and the remaining 4 percent was for processing. The Palmetto-Ruskin area accounted for 37.3 percent of the production; Dade County, 19.2 percent; the southwest, 30.8 percent and the Ft. Pierce-Pompano area, 8.8 percent. The remainder of the production was in the west, north, and north central areas.

The state average yield, at 817 (30-pound) cartons per acre, was up 129 cartons from the previous season. This increase was due to the very mild crop year and favorable market which enabled growers to extend the harvest season. Dade County supplies the bulk of winter tomatoes. Fall shipments peaked in December, which accounted for 14.4 percent of the season's market sales. Spring production reached a peak in May, which amounted to 26.4 percent of the season's total. Tomatoes are usually harvested continuously from late October to mid June.

The Palmetto-Ruskin area continued to be the acreage leader, with 13,050 acres harvested. The southwest area ranked second, harvesting 11,200 acres. Dade County harvested 10,750 acres, and the Ft. Pierce-Pompano area, 4,000 acres. There were 1,800 acres harvested in the north, north central, and west areas, 13 percent more than last year. Most of this increase in acreage was in Gadsden County.

Tomato planting got underway in the Gadsden County area in July and started in other areas in August. Heavy rains in early September delayed plantings, washed beds, damaged young seedlings in low areas and leached fertilizer in some fields. Damage was minimal. Hot weather caused excessive replanting and bloom droppage. Mostly favorable weather prevailed throughout the remainder of the fall season. During the early winter season, strong, cold winds in January caused considerable leaf burn and fruit scarring. Below normal temperatures and strong, cold winds in February slowed plant growth and caused some bloom and fruit droppage along with some young plant loss. Weather conditions were very favorable for the spring season, although strong winds in early April whipped plants and scarred some fruit. In mid May, light damage in low spots from heavy rains occurred in the Palmetto-Ruskin area. Minor hail damage was also reported in some areas. Most growers were able to get considerably more pickings than normal as prices held up well which gave the incentive to extend the harvest period.

WATERMELONS
1978-79

Watermelon acreage planted during the 1978-79 season totaled 50,000 acres -- 15 percent less than the previous season. Of the total acres planted, only 43,000 acres were harvested -- down 14 percent from 1978. The crop of 6.5 million cwt. was down 19 percent from the year before and the lowest production since the 1961-62 season. The average yield varied considerably by areas with the western counties averaging only 90 cwt. per acre and counties in the southwest averaging 232 cwt. per acre. The State average was 150 cwt. per acre, down 10 cwt. from the previous year and the lowest average since the 1973-74 season.

The average price received was a record 5 cents per pound compared with 3.4 cents received last season and the previous high of 4.4 cents per pound received for the 1974-75 crop. Higher prices in the southern and central areas helped offset lower prices in the north and west. The value of the crop was $32.3 million, second only to the 1974-75 crop which had a value of $35.2 million.

The watermelon harvest usually begins in the Immokalee area in late March and early April, depending on weather conditions. For the third consecutive season, harvest did not get underway until May. The season progresses northward into the central areas during May and the northern areas in June and comes to an end in the western counties by mid July. As usual June was the heaviest shipping month during the 1978-79 season.

First plantings were made in the Immokalee area in late December. Cold, wet weather prevented good seed germination and spot replanting was necessary. Vine growth was very slow and the crop made little progress early in the season. The first melons did not move from the area until late April and there was only light volume until early May.

Planting was underway in the north central areas by mid February and in the north and west in late February and early March. Harvest was underway in the central areas by mid May and in the north by early June. Production prospects were very good in these areas but many growers were caught with ripe melons in the field by the truckers strike during the last half of June. Because of the lack of transportation, many fields were abandoned and a large acreage was picked only once. This contributed heavily to the low yield and high acreage abandonment in the northern and western growing areas.

Harvest continued into July in both the north and west. A shortage of trucks remained as a major problem until the end of the season. By the last half of July the shipping season was over except for an occasional load. Local sales continued through the month of July.

OTHER CROPS
1978-79

Cantaloups are grown in Florida primarily in the southwest and north central areas. Much of the production is sold through roadside stands and local markets. The peak harvest period is normally May and June. Harvest begins in the southwest and progresses northward seasonally.

Acreage continues at a relatively low level. However, this crop is not part of the regular statistical program for vegetables and melons. Researchers are working to develop several new varieties that will be better adapted to Florida's soils and climate. There appears to be some promise that acreage may expand in the future.

Cauliflower continues to expand in the Zellwood, Hillsborough-Manatee and Everglades areas. Supplies are available from November through April. At the present time statistics are not available for publication. However, if this crop continues to grow it could become part of the regular statistical program at some time in the future. Shipment data are being recorded by the Market News Service. In the 1978-79 season there were 65 thousand hundredweight shipped out-of-state. This converts to 295 thousand, 22-pound cartons. Data for the previous crop year are not available.

Sub-tropical vegetable production increased substantially from the previous year due primarily to improved yields. Improved fertilization and spray programs contributed to the better yields. Most of the acreage is grown in Dade County. Commercial production began in the early 60's. Sub-tropical vegetables is a colloquial expression applied to certain vegetables eaten primarily by those of Latin American and Caribbean origin. The most common name for each crop followed by the scientific name is listed below. Other common terms for the various vegetables are shown in parentheses. The crops consist primarily of boniatos-ipomea batatos (sweet potato); calabaza-cucurbita (pumpkin); malanga-xanthosoma sagitaefolium (dasheen, yautias); and yuca-monihot esculenta (sweet cassava). The boniato, calabaza and malanga constitutes the bulk of the production. The Dade County Extension Service reported 10,470 acres of sub-tropical vegetables, planted in the 1978 calendar year. Peak production of the malanga occurs in February through April. Efforts are now underway to even out the supply throughout the year. Miami is an important point of consumption for the Florida production. Also, considerable amounts are consumed in the Tampa Bay area. The supplies shipped out of the state are primarily for the New York City and Philadelphia areas.

Collard, turnip, mustard and other greens are grown throughout the state and centered around the large population areas and in the muck soils of the Everglades and Zellwood areas. Good volume is available November through March. Shipments totaled 141,000 cwt. during the 1978-79 season, about the same as the 140,000 cwt. shipped a year earlier.

Okra is grown in many areas of the state during the warm season of the year. However, Dade County produces okra for local use as well as for shipments to other states. Peak production takes place in May and June with a good supply in November.

Green onions and leeks are produced in the north central areas. Supplies are marketed primarily for local use at roadside stands and markets. Supplies of dry onions are limited. Most of the dry onions are produced in southern areas of the state.

Parsley is available in both the curley and plain types. The bulk of the commercial volume shipped to other states is produced in the Everglades and Zellwood areas. Light volume sold for local use is available from the Sarasota, Lake Placid and other areas.

Southern peas are grown primarily in the northwest, west central and Everglades areas of Florida. Dade County also produces a considerable amount of southern peas. Light supplies are available September through December. Heavy movement occurs during May and June, especially in northwest Florida. A high percentage of the crop goes to processing. Good supplies are sold through local markets for fresh use. Market News Service shipment statistics for out-of-state markets, shows 13,000 cwt. for fresh market during the 1978-79 season.

Watercress is available the year round. The major source of supply is Oviedo. Most of the production is shipped to northern and eastern markets in the United States. A limited supply is available from local state farmers markets, especially the Sanford Market.

ACKNOWLEDGMENT

This publication summarizes basic information concerning Florida's poultry industry. It is intended for the use of poultrymen, allied industries and all others who are interested in poultry production.

Many producers, hatcherymen, marketing agencies and others voluntarily supplied information used to develop these statistics. Their cooperation is sincerely appreciated.

This summary is made possible through a cooperative effort of the Florida Crop and Livestock Reporting Service and the Bureau of Market News, Division of Marketing and the Poultry and Egg Section, Division of Inspection, Production and inventory data are official state and USDA statistics prepared by the Florida Crop and Livestock Reporting Service.

This publication was prepared under the direction of Ed C. James, Jr. of the Florida Crop and Livestock Reporting Service.

Published June 1980

POULTRY AND EGG SUMMARY

Florida poultrymen received 213.3 million dollars for broilers, eggs, and other poultry products in 1979. This is an increase of 18 percent from the 1978 cash receipts of 180.7 million dollars. Receipts from commercial sales of eggs, at 130.1 million dollars, were up 24 percent. Producers of broilers received 78.7 million dollars, 8 percent more than 1978. Cash receipts for other poultry products amounted to 4.6 million dollars compared with 3.2 million dollars in 1978.

In 1979, eggs returned producers an average of 49.0 cents per dozen, up 6.3 cents from the previous year. Broiler prices averaged 25.0 cents per pound, liveweight basis, compared with 24.8 cents in 1978.

The annual average number of Florida layers declined in 1972 and 1973 after 15 years of steady growth. Numbers remained stable for the next few years and then started upward in 1976. In 1979, layers reached a record 13,049,000, 3 percent above the previous 1977 record and 6 percent more than 1978.

The daily rate of lay per 100 layers in 1979 was 66.9, about 2 percent more than a year earlier. Egg production in 1979 was a record 3,189 million eggs. This was 6 percent above the previous 1977 record and up 8 percent from 1978.

During 1979 commercial hatcheries produced 142.7 million straight run chicks. Broiler-type chicks, at 103.9 million, accounted for 73 percent of the total, with egg-type chicks making up the remaining portion. Broiler-type chicks hatched were up 7 percent from 1978. Egg-type hatch, at 38.8 million, was up 2 percent.

TERMS AND DEFINITIONS

MARKETING YEAR--Poultry production, price and value statistics since 1970, are for the marketing year beginning December 1 through November 30. All statistics prior to 1970 are on a calendar year basis. For comparability, in those tables where monthly data are shown, December entries always refer to the preceding year. All hatch and hatchery placement data are reported on a calendar year basis.

BROILERS are meat-type chickens raised commercially and usually marketed in 7 - 8 weeks.

EGGS include both table and hatching eggs. Table egg prices are calculated on a farm basis, cases exchanged. They include all grades and sizes, but exclude charges for hauling, grading or packaging. Prices for hatching eggs are not published separately. Annual egg production, price and value statistics are for table and hatching eggs combined.

OTHER POULTRY cash receipts include chickens other than broilers, turkeys and miscellaneous farm poultry products.

CASH RECEIPTS are the returns received by farmers for all sales.

GROSS INCOME includes cash receipts plus the value of home consumption.

CURRENT YEAR data are preliminary and subject to revision.

SURVEY METHODOLOGY--Monthly estimates of hens and pullets of laying age, pullets not yet of laying age, and of egg production are based upon data obtained from a sample of commercial chicken and egg producers. This sample is selected from the universe of Florida poultry management units, and includes approximately 80 percent of the total commercial laying flock. Monthly estimates are expected to be within five percent of the value obtained if a complete enumeration were undertaken each month.

During December of each year all known commercial egg producers in Florida are contacted. This complete enumeration establishes the annual universe of management units. Management units include all independent producers as well as contractors who report for all contractees. The table below shows the stratification of the universe established by the annual survey of December 1979 and the number of units in the sample selected for the monthly survey in the first half of 1980.

NUMBER OF MANAGEMENT UNITS IN THE UNIVERSE, DECEMBER 1979, AND SAMPLE, 1980 .

DOYLE CONNER
COMMISSIONER

Dear Friend:

The significance of the livestock industry to Florida agriculture is reflected in the dollar volume of livestock and their products sold, which in 1979 amounted to more than 1.0 billion dollars. Florida ranks ninth among all states in beef cows and first in beef cow numbers among states east of the Mississippi River.

Important production, marketing and policy decisions must be based upon accurate information. This publication provides statistical data which help meet this need.

The basic data for this publication was supplied by voluntary reporters from the livestock industry and compiled through the cooperation of the Florida Department of Agriculture and Consumer Services and the U.S. Department of Agriculture.

Sincerely,

Doyle Conner

ACKNOWLEDGMENT

Many livestock producers and ranchers, slaughterers, auctions, feed lots, and other agencies associated with the livestock industry offered suggestions or voluntarily supplied basic data used to develop these statistics. Their contributions are sincerely appreciated.

The inventory, production, slaughter, utilization, monthly and annual average price, and livestock value statistics for Florida are official State and USDA estimates prepared by the Crop and Livestock Reporting Service. Corresponding data for other livestock producing States are from official reports of the USDA Economics, Statistics, and Cooperatives Service. Information on shipments, auction market prices, and special feeder sales are from cooperative work between the Florida Department of Agriculture and Consumer Services, Livestock Market News Section and the Divisions of Inspection and Animal Industry and the USDA's Market News Branch, Agricultural Marketing Service.

LIVESTOCK SUMMARY

CATTLE AND CALVES ON FARMS

Florida's January 1, 1980 inventory of all cattle and calves, including both beef and dairy animals, totaled 2,300,000 head. This was 120,000 head more than a year earlier and represents a 6 percent increase. On January 1, 1980, cows and heifers that have calved totaled 1,357,000 head, up 1 percent. Beef cows increased 24,000 from the previous year and milk cows were down 5,000 head.

Florida ranked 15th in the nation in total cattle and calves, 9th in beef cow numbers and 17th in milk cow numbers on January 1, 1980. A total of 573,000 cattle and calves were shipped out of Florida during 1979.

CASH RECEIPTS

Cash receipts from Florida's cattle and calves marketed in 1979 totaled $422,199,000, up 18 percent from 1978. Cattle prices in 1979 averaged $65.50 per hundredweight compared with $43.30 in 1978. Calf prices averaged $95.30 per hundredweight, compared to $59.40 in 1978. Marketings of cattle and calves in 1979 totaled 534,460,000 pounds, down 26 percent from the previous year.

Receipts from hog marketings totaled $51,676,000 in 1979, an increase of 42 percent from 1978. Prices received for hogs averaged $40.60 per hundredweight in 1979, $3.40 lower than the previous year's price.

HOGS ON FARMS

The December 1, 1979 hog inventory in Florida totaled 425,000 head, up 18 percent from a year earlier. On December 1, 1979, there were 66,950,000 hogs and pigs in the United States, an increase of 11 percent from December 1, 1978.

BEES AND HONEY

Florida's 1979 honey production of 28,080,000 pounds was up 18 percent from last year and was valued at $14,826,000. The peak number of colonies in production totaled 360,000, up 4,000 from 1978. Florida ranks first in the nation in honey production and second in number of colonies. Producers received an average of 52.8 cents per pound for all grades and types, 3.4 cents more than in 1978. Beeswax brought an average of $1.70 per pound, down 3 cents from last year.

SURVEY METHODOLOGY

Primary data used in making cattle inventory estimates in this summary were obtained from probability surveys. Nationally, these surveys include approximately 70,000 farming operations heavily weighted to include operations having cattle. Information is collected by mail, telephone and personal interviews. Since all operations with cattle are not included in the sample, survey estimates are subject to sampling variability. This variability, as measured by the relative standard error, is about one percent at the national level for cattle inventory. This means that chances are approximately 95 out of 100 that a survey estimate will be within two percent of the complete coverage value if the same procedures were used to survey all producers. In Florida, approximately 1,400 cattle producers were surveyed with most of the large farms and ranches included in the count. As would be expected, the relative standard error for Florida and other states is greater than at the national level because of the smaller number of farms in the state samples.

Survey estimates are also subject to non-sampling errors such as omissions, duplications, recording and processing the data and mistakes in reporting. These errors cannot be measured directly, but they are minimized through rigid quality controls on the data collection process and a careful review of all reported data.

In setting the inventory estimates, survey information on births and deaths is used as well as inventory numbers. The survey results are combined with reliable data from other sources on slaughter, imports and exports to construct national and state balance sheets, which provide an additional check on survey inventory estimates.

ACKNOWLEDGMENT

The publication of this bulletin was made possible through the efforts and cooperation of many individuals as well as private and governmental institutions. To all of them the Florida Crop and Livestock Reporting Service expresses its appreciation.

Many farmers and agricultural enterprises have voluntarily supplied information to develop these statistics. The Agricultural Stabilization and Conservation Service has been a source of much basic data on crops under USDA programs. Others contributing information were the Florida Department of Agriculture, Agricultural Experiment Station and Cooperative Extension Service.

This bulletin is published by the Florida Crop and Livestock Reporting Service, a cooperative agency of the Economics, Statistics and Cooperatives Service, USDA, Florida Department of Agriculture; and Florida Agricultural Experiment Station. Acreage, production, and value data are official statistics assembled under the direction of Gerald H. Moody and Carl A. Ouzts of the Florida Crop and Livestock Reporting Service.

INTRODUCTION AND SUMMARY OF THE 1979 FIELD CROPS SEASON

INTRODUCTION

This publication, released annually, contains statewide estimates of acreage, yield, production and value of production for all major field crops grown in Florida. The period covered for these crops is from 1969 through 1979. County data for the important producing counties which grow corn, soybeans, sugarcane, peanuts, tobacco, and cotton are published for the years 1978 and 1979. The complete series of crop estimates dating back to 1919 for the State are available upon request.

Crop estimates are designed to aid Florida farmers, bankers, credit organizations, transportation officials, research workers and others in agriculture keep abreast of changes and appraise the current and future needs in the light of past experiences. These estimates represent a part of the Department's continuing program to provide comprehensive data for the various segments of agriculture.

SUMMARY 1979 SEASON

Temperatures during early January 1979 were average but by late January and through early April temperatures averaged well below normal. Rainfall during the early months was near normal and soil moisture was mostly adequate during that period. Most field crops were planted a little earlier than usual. Harvest of early planted crops was underway by late spring and early summer. Harvest made good progress during the summer months. In early September Hurricane David moved up the east coast but damage to field crops was small. Some sugarcane was blown over; however, practically all the acreage was harvested. Hurricane Frederic moved out of the Gulf and made a landfall near Mobile, Alabama. Strong winds and heavy rainfall caused some damage to soybeans in the western edge of the Panhandle. Damage to the soybean crop was not extensive but yields were reduced. By late fall all crops except soybeans and sugarcane had been harvested. The year 1979 was good for most field crops. Average yields for the major field crops grown were a little higher than 1978 except peanuts. Record yields were realized for soybeans and tobacco.

Total acreage planted to corn in 1979 was down slightly from the year before. Acreage harvested for grain was three percent less than 1978 but was 20 percent more than 1977. The average yield was 53 bushels per acre, one bushel above a year earlier. The average price received per bushel was $2.85, well above the $2.10 received in 1978. The value of the 1979 corn crop is placed at $54,378,000, nearly 35 percent more than 1978.

The total area planted to soybeans climbed to a record 460,000 acres in 1979 and was the largest acreage planted to a field crop in the State. Total acreage harvested for beans was 453,000 acres, an increase of over 10 percent from 1978. The average yield was 29 bushels per acre, a record for the State. The average price received was $6.60 per bushel, down slightly from the $6.80 average received for the 1978 crop. Value of the soybean crop was placed at $86,704,000 – 24 percent more than the year before and second only to sugarcane as the State's most valuable field crop.

Total acreage of sugarcane harvested for sugar and seed continued to increase and is estimated at 330,800 acres. Of this total, 318,200 acres were harvested for use in making sugar and the remaining 12,600 acres were used for planting new or additional acreage. Average yield for acreage harvested in the fall of 1979 and winter of 1980 was 31.4 net tons of cane per acre. Total tons produced, including cane used for seed, was 10,387,000 tons, seven percent more than the previous season. The value of the crop will not be available until a later date. The 1978 value of production for sugarcane used for sugar and seed was $198,871,000, averaging $20.50 per ton.

Production of all hay totaled 494,000 tons, up five percent from 1978 and was a record production for Florida. Hay, all types, was harvested from an estimated 235,000 acres, the same as the year before. Hay producers averaged 2.10 tons per acre, up from the 2.00 ton average of a year ago and accounted for the increased production. Growers selling hay received $58.50 per ton, up from $58.00 received in 1978. The total value of all hay produced was $28,899,000, an increase of six percent from 1978.

There were 64,000 acres of peanuts planted in the State in 1979. Of this total, 55,000 acres were harvested for dry peanuts. The remaining 9,000 acres were harvested for green peanuts and all other purposes. The crop harvested for dry peanuts averaged 3,270 pounds per acre, down 110 pounds from the record yield of 3,380 pounds of last year. A ton of peanuts averaged $420.00 in 1979 compared to $426.00 per ton received in 1978. The value of dry peanuts was placed at $37,769,000, a decrease of three percent from the year before.

Production of flue cured tobacco totaled 22,400,000 pounds. There were 10,000 acres harvested in the State in 1979. This was 5 percent less than 1978 and the smallest acreage since 1936. The average yield per acre was 2,240 pounds, a record for the State. Florida's tobacco crop was valued at $30,240,000, down five percent from 1978 but nearly 3 percent above the 1977 crop. The average price received for all grades was $1.35 per pound, down from the $1.44 per pound received for the 1978 crop.

The total area planted to cotton was 3,400 acres. Acreage at this level is the smallest on record. There was virtually no acreage abandonment in 1979. In 1979 the average yield was 565 pounds of lint per acre, up 59 pounds from 1978 and the highest yield since 1972. The average price per pound of lint was 65.0 cents for the season, up 5.0 cents from 1978. Cotton was valued at $1,248,000 in 1979, up 14 percent from the year before.

Production of all pecans in Florida totaled 2,600,000 pounds – down 38 percent from 1978 and 57 percent less than 1977. Of this total 1,100,000 pounds were classified as improved varieties and 1,500,000 pounds were classified as native and seedling varieties. The average price of all pecans was 58.5 cents per pound. The improved varieties brought an average of 70.0 cents per pound while the native and seedlings averaged 50.0 cents. The value of the pecan crop was placed at $1,520,000 – down 36 percent from the 1978 value of $2,366,000.

"WHY CROP AND LIVESTOCK REPORTS"

A man's judgment is no better than his facts and crop and livestock reports are the basic facts of Agriculture.

They aid farmers in planning their production and marketing and provide them with an orderly market.

They are the basis for analysis of agriculture and other business conditions.

They enable railroads to make better distribution of cars for moving farm products.

They give producers the same foresight to future price trends that organized dealers possess.

They are a check on fluctuation in price by removing uncertainty of supply.

They are the best basis for adjusting supply to demand which is highly essential if maximum price is to prevail.

They aid farm organizations, schools and others in planning constructive programs.

They give information on surplus and deficit areas of production making possible a more economical distribution of products.

They are a guide to farm resources and for developing new resources such as irrigation, electric power, location of food processing and other factories.

They reduce uncertainty which limits speculation in farm products. Speculation adds to the cost of marketing.

They indicate potential buying power enabling manufacturers to meet the probable demand.

They provide an accurate, reliable, unbiased picture of Florida's agriculture and furnish a sound basis for judgment and action by farmers, other individuals, business men, transportation agencies, crop and livestock interests, and governmental agencies.

ACKNOWLEDGMENT

This publication summarizes basic information concerning Florida's dairy industry. It is intended for the use of dairymen, allied industries, and all others who are interested in dairy statistics.

Many dairy producers, marketing agencies, Federal Order Market Administrators, and others voluntarily supplied basic data used to develop these statistics. Their cooperation is sincerely appreciated.

This report is made possible through a cooperative effort of the Florida Crop and Livestock Reporting Service and the Dairy Farm Inspection Section of the Division of Dairy Industry. Shipment data are from the Road Guard Section, Division of Inspection. Production and inventory data are official State and USDA statistics prepared by the Florida Crop and Livestock Reporting Service.

DAIRY SUMMARY

On January 1, 1980, cows kept for milk production on Florida farms and commercial dairies numbered 184,000 head, 5,000 less than a year earlier. Milk cow replacement heifers, 500 pounds and over, on hand January 1, 1980, totaled 35,000 head, 8 percent less than last year. The combined total of milk cows and replacement heifers, 500 pounds and over, was 219,000 head, 4 percent less than January 1, 1979.

Florida dairies produced 1,966 million pounds of milk in 1979. Production was 1 percent above the previous year. Production per cow averaged 10,457 pounds in 1979 which was 364 pounds more than the 1978 average.

Cash receipts from marketings of Florida milk in 1979 totaled $282,081,000, an increase of 14 percent from 1978. The combined price from these marketings in 1979 which includes both producer and producer handler milk averaged $14.51 per hundredweight.

Milk cow numbers in the United States continued to decline and totaled 10.8 million on January 1, 1980. This was slightly below a year earlier. Milk cows and milk replacement heifers of 500 pounds or more totaled 15.0 million head, 1 percent above the previous year.

Annual milk production per cow in the United States averaged 11,471 pounds in 1979, up 253 pounds from 1978. There were 123.6 billion pounds of milk produced in 1979, a 2 percent gain from the previous year and 3 percent below the record 1964 output of 127.0 billion pounds.

Farmer's cash receipts from marketings of milk in 1979 were a record high $14,668 million for the Nation, 16 percent more than the previous record of $12,690 million in 1978.
